

# Bias and systematics in observational measurements of supernova hosts across cosmic time

**Ana Paulino-Afonso**

*in collaboration with Ana Mourão, Santiago González-Gaitán, Lluís Galbany & the CRISP team*

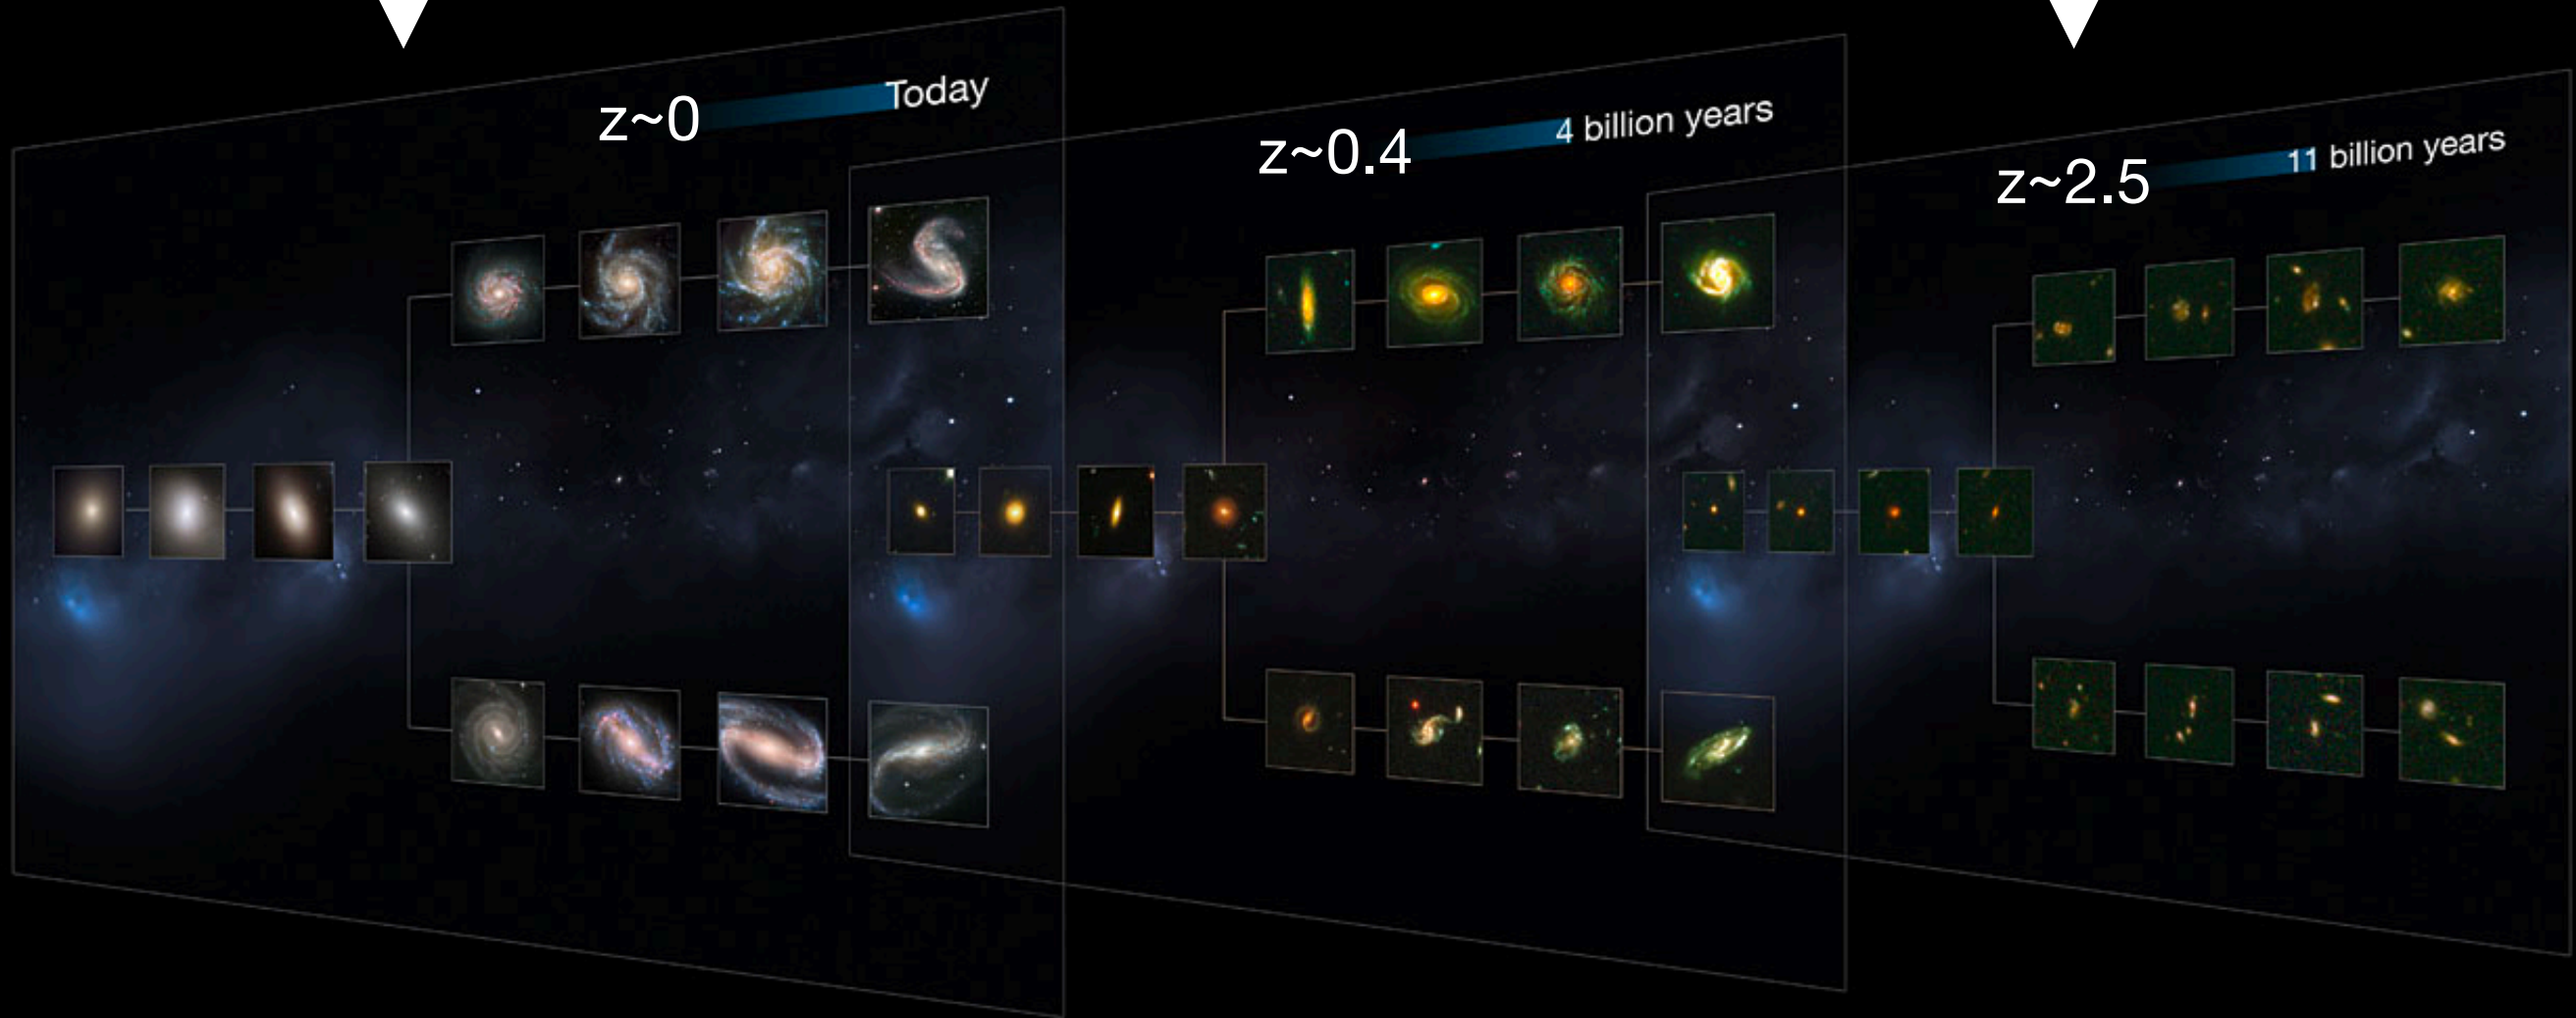

**CRISP virtual Meeting 2020**

July 7, 2020

# The Hubble Diagram throughout the Universe's history

big, fully formed and intricate shapes

smaller and less mature, difficult to distinguish between different visual types

© NASA, ESA, M. Kornmesser; the CANDELS team (H. Ferguson)

# The future of SN Ia Cosmology

© Scolnic et al. (2019)

## The Future of SN Ia Cosmology at a Glance

### Low-z [ $z < 0.1$ ]

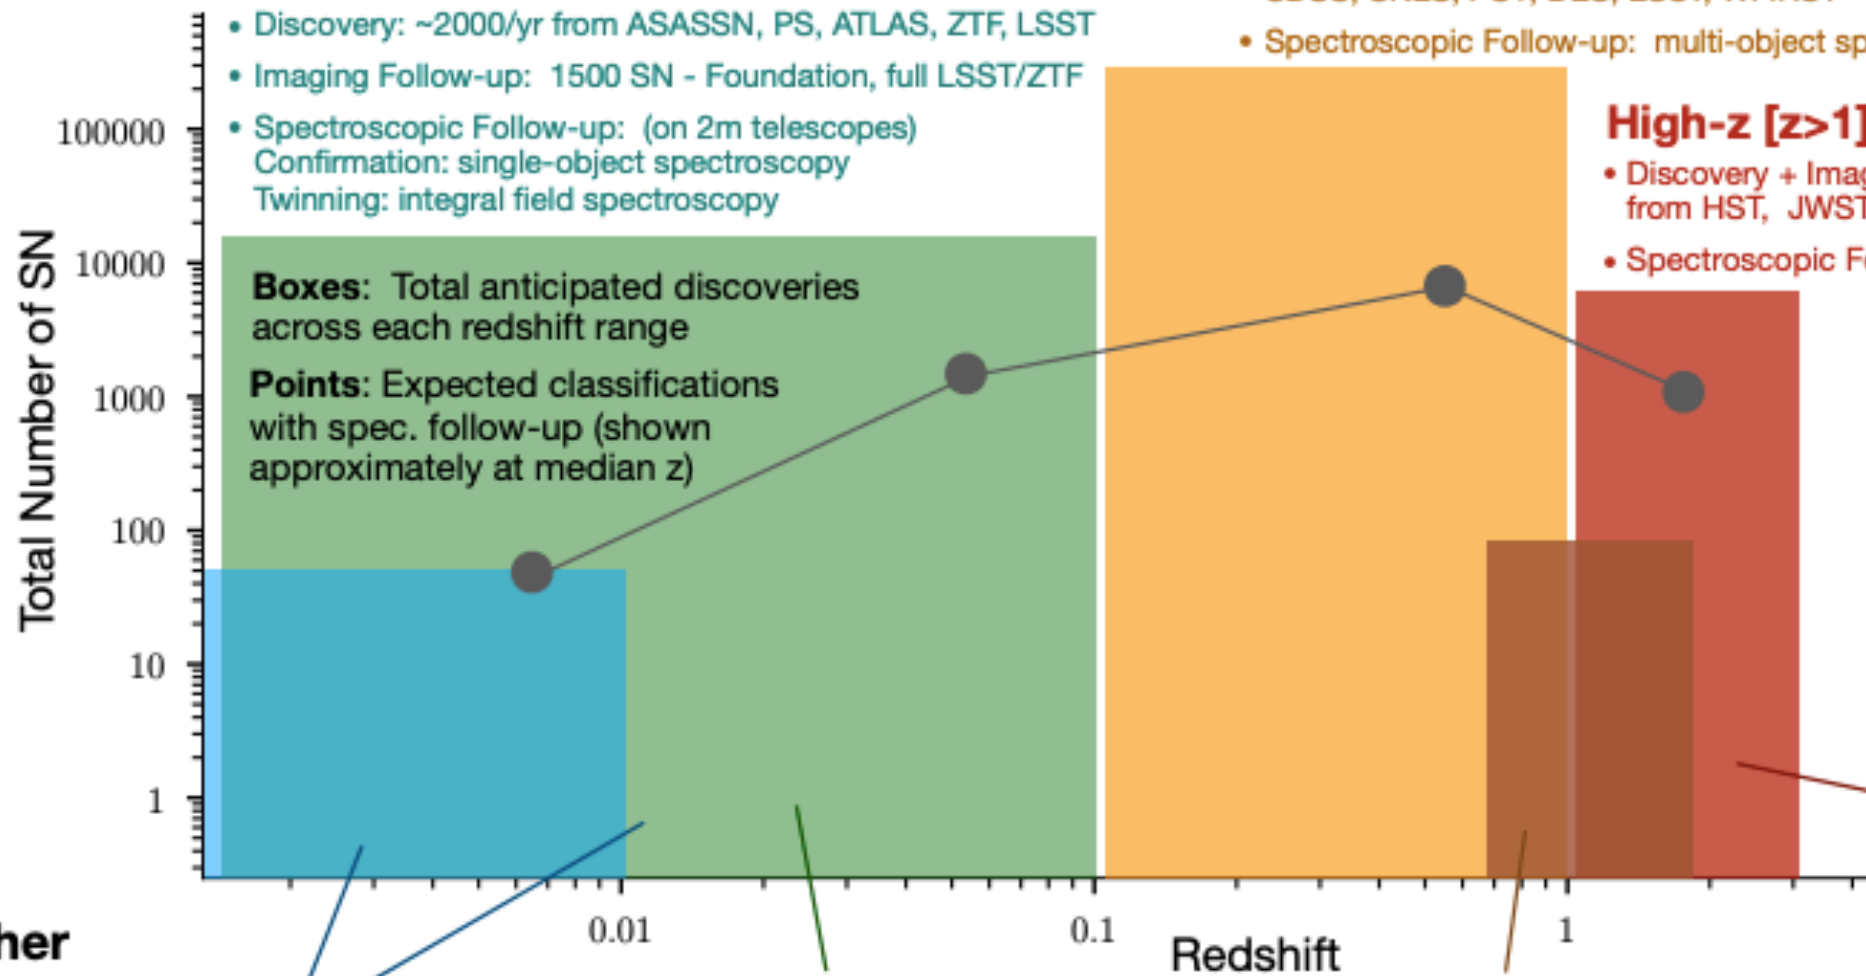

- Discovery: ~2000/yr from ASASSN, PS, ATLAS, ZTF, LSST
- Imaging Follow-up: 1500 SN - Foundation, full LSST/ZTF
- Spectroscopic Follow-up: (on 2m telescopes)  
Confirmation: single-object spectroscopy  
Twinning: integral field spectroscopy

### Mid-z [ $0.1 < z < 1$ ]

- Discovery + Imaging: >300,000 photometric, 6,000 spectroscopic from SDSS, SNLS, PS1, DES, LSST, WFIRST
- Spectroscopic Follow-up: multi-object spec. on 4-8m telescopes

### High-z [ $z > 1$ ]

- Discovery + Imaging: ~6,000 photometric, 1,000 spectroscopic from HST, JWST, WFIRST
- Spectroscopic Follow-up: JWST, WFIRST, 8m+, ELTs

**Constraints on  $w(z)$  from the SNIa Hubble diagram**

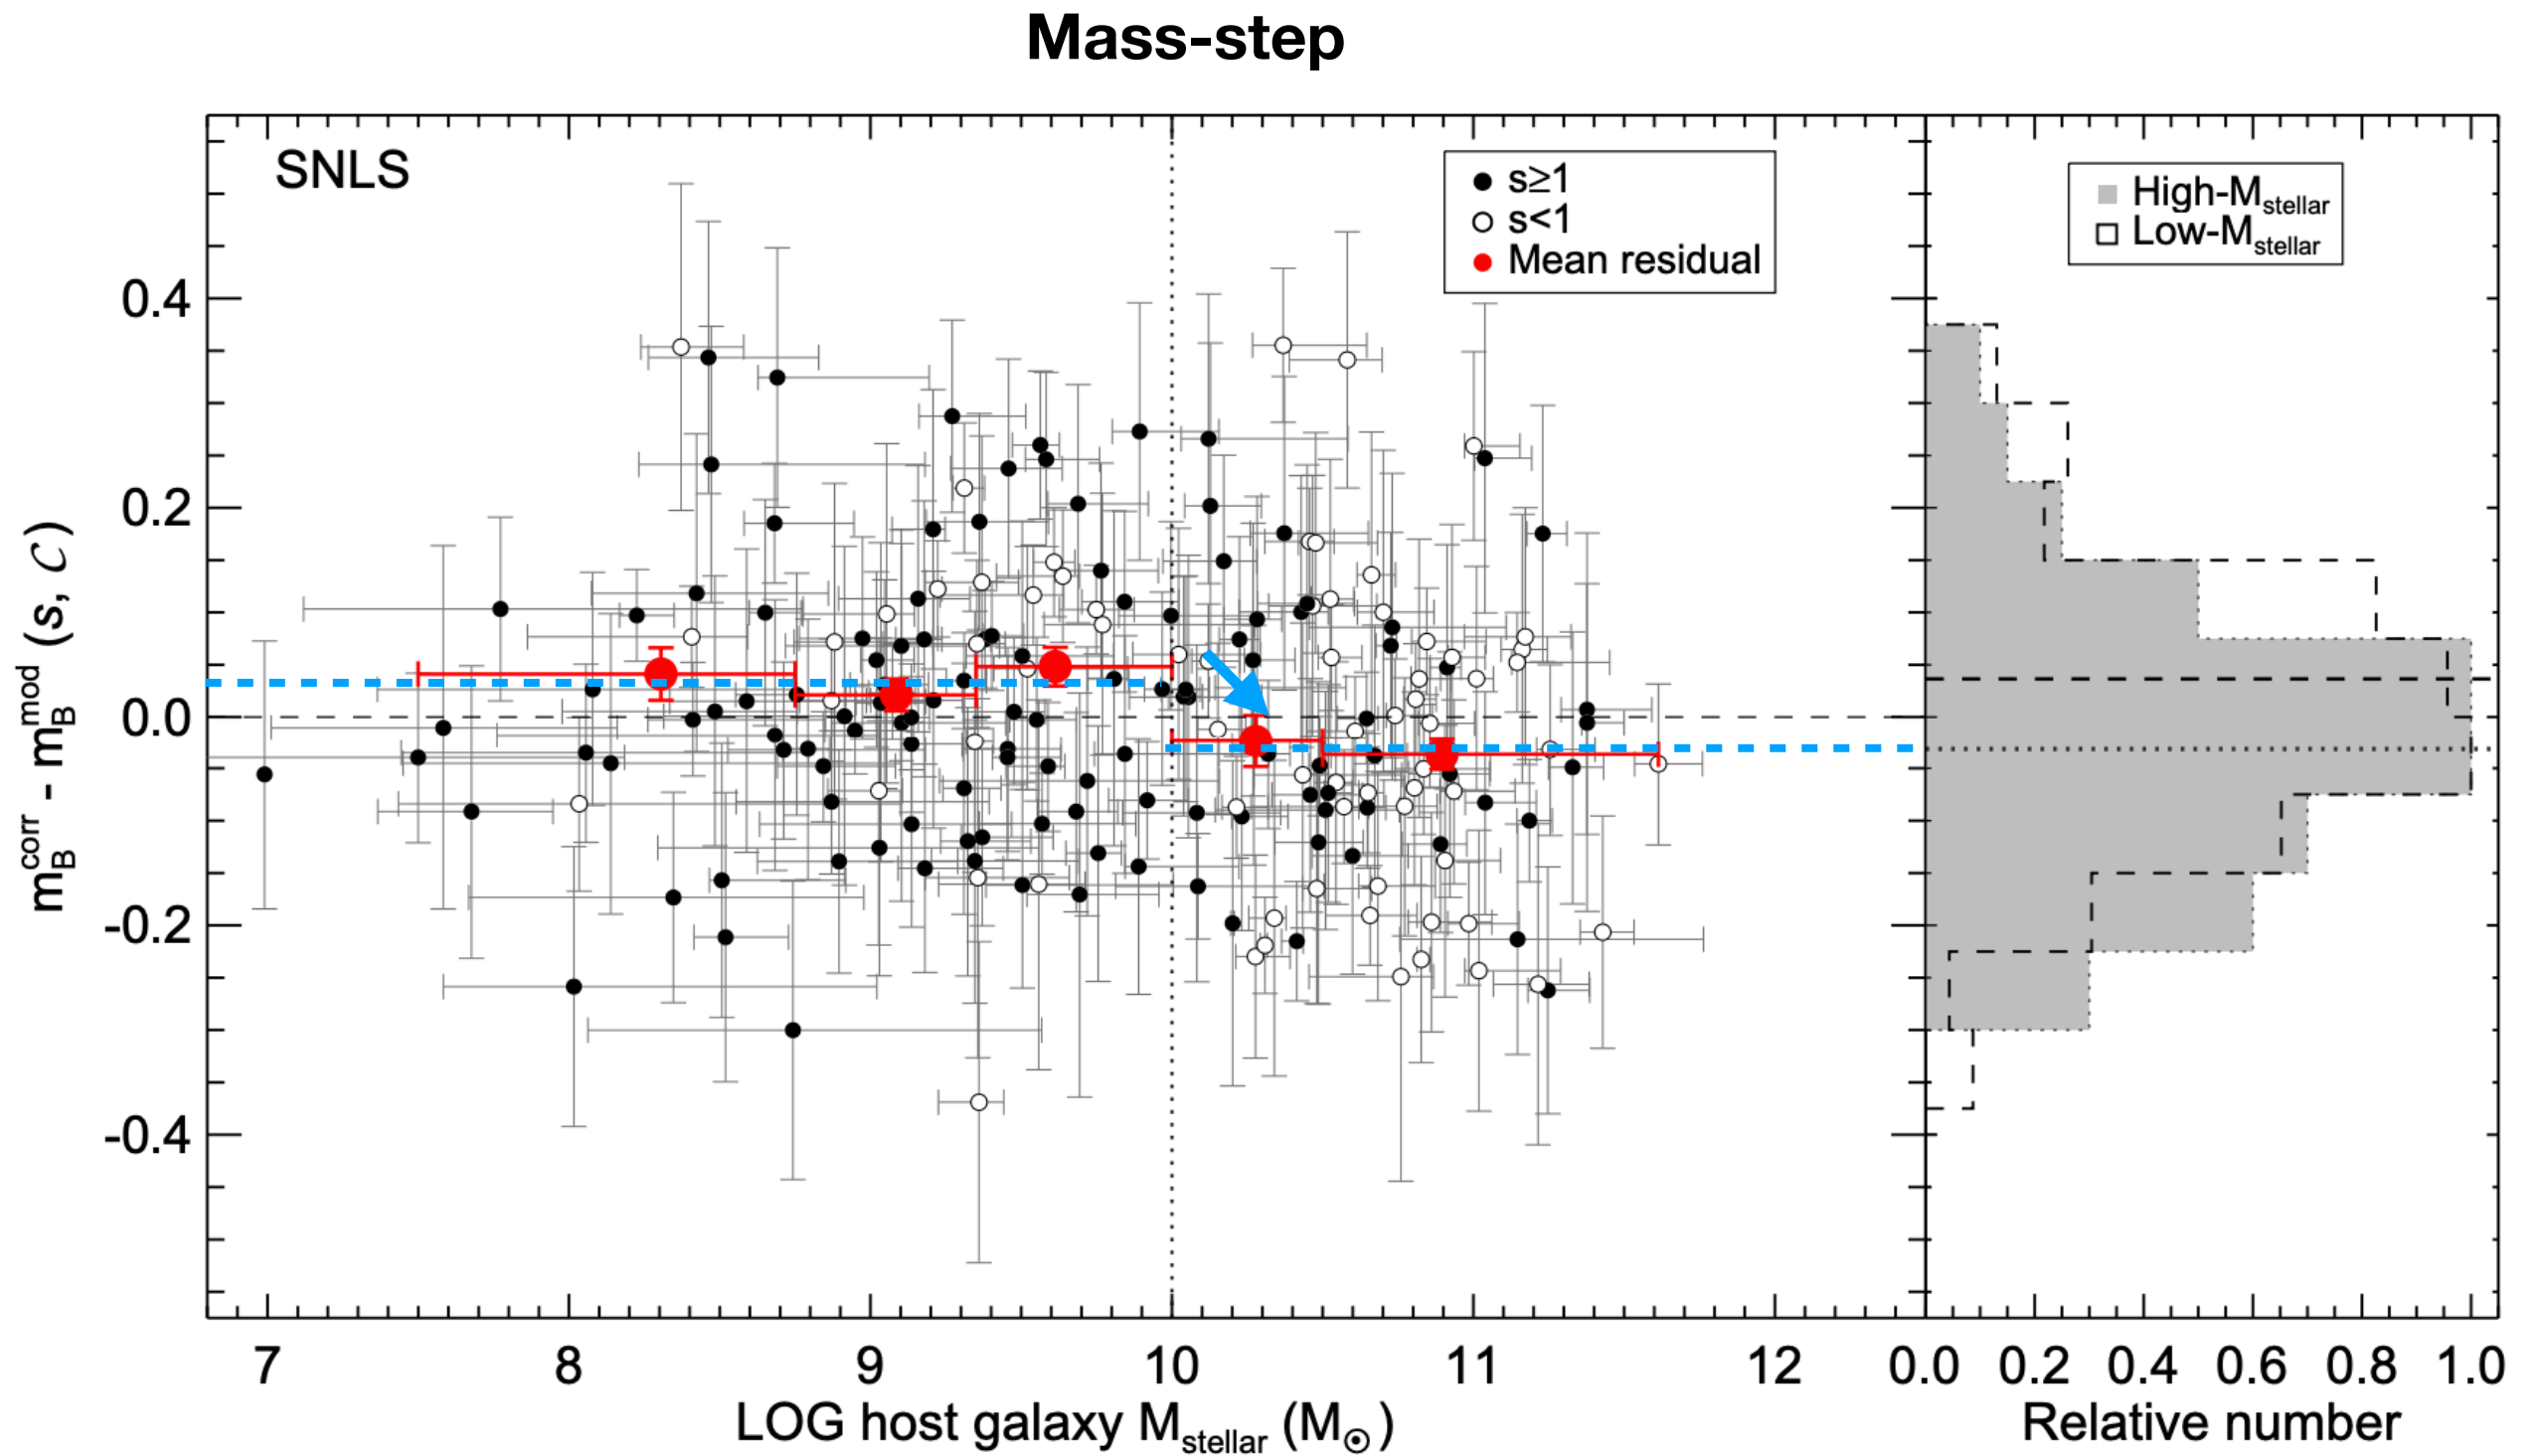

Top Systematics for measuring  $w$ :

- Calibration across wavelength range
- Intrinsic scatter, Population Drifts
- Classification

Additional avenues include isotropy tests and galaxy survey correlations

© Ilbert et al. (2013)

# Artificial redshifting galaxies

This is the general scheme that describes how to transform a source observed in one instrument into an higher redshift image observed with a different instrument.

© FERENGI, Barden et al. (2008)

© “DOPTERIAN”, Paulino-Afonso et al. (2017)

# Artificial redshifting galaxies

© Paulino-Afonso et al. (2017), code available at GitHub: [asofiafonso/Dopterian](https://github.com/asofiafonso/Dopterian)

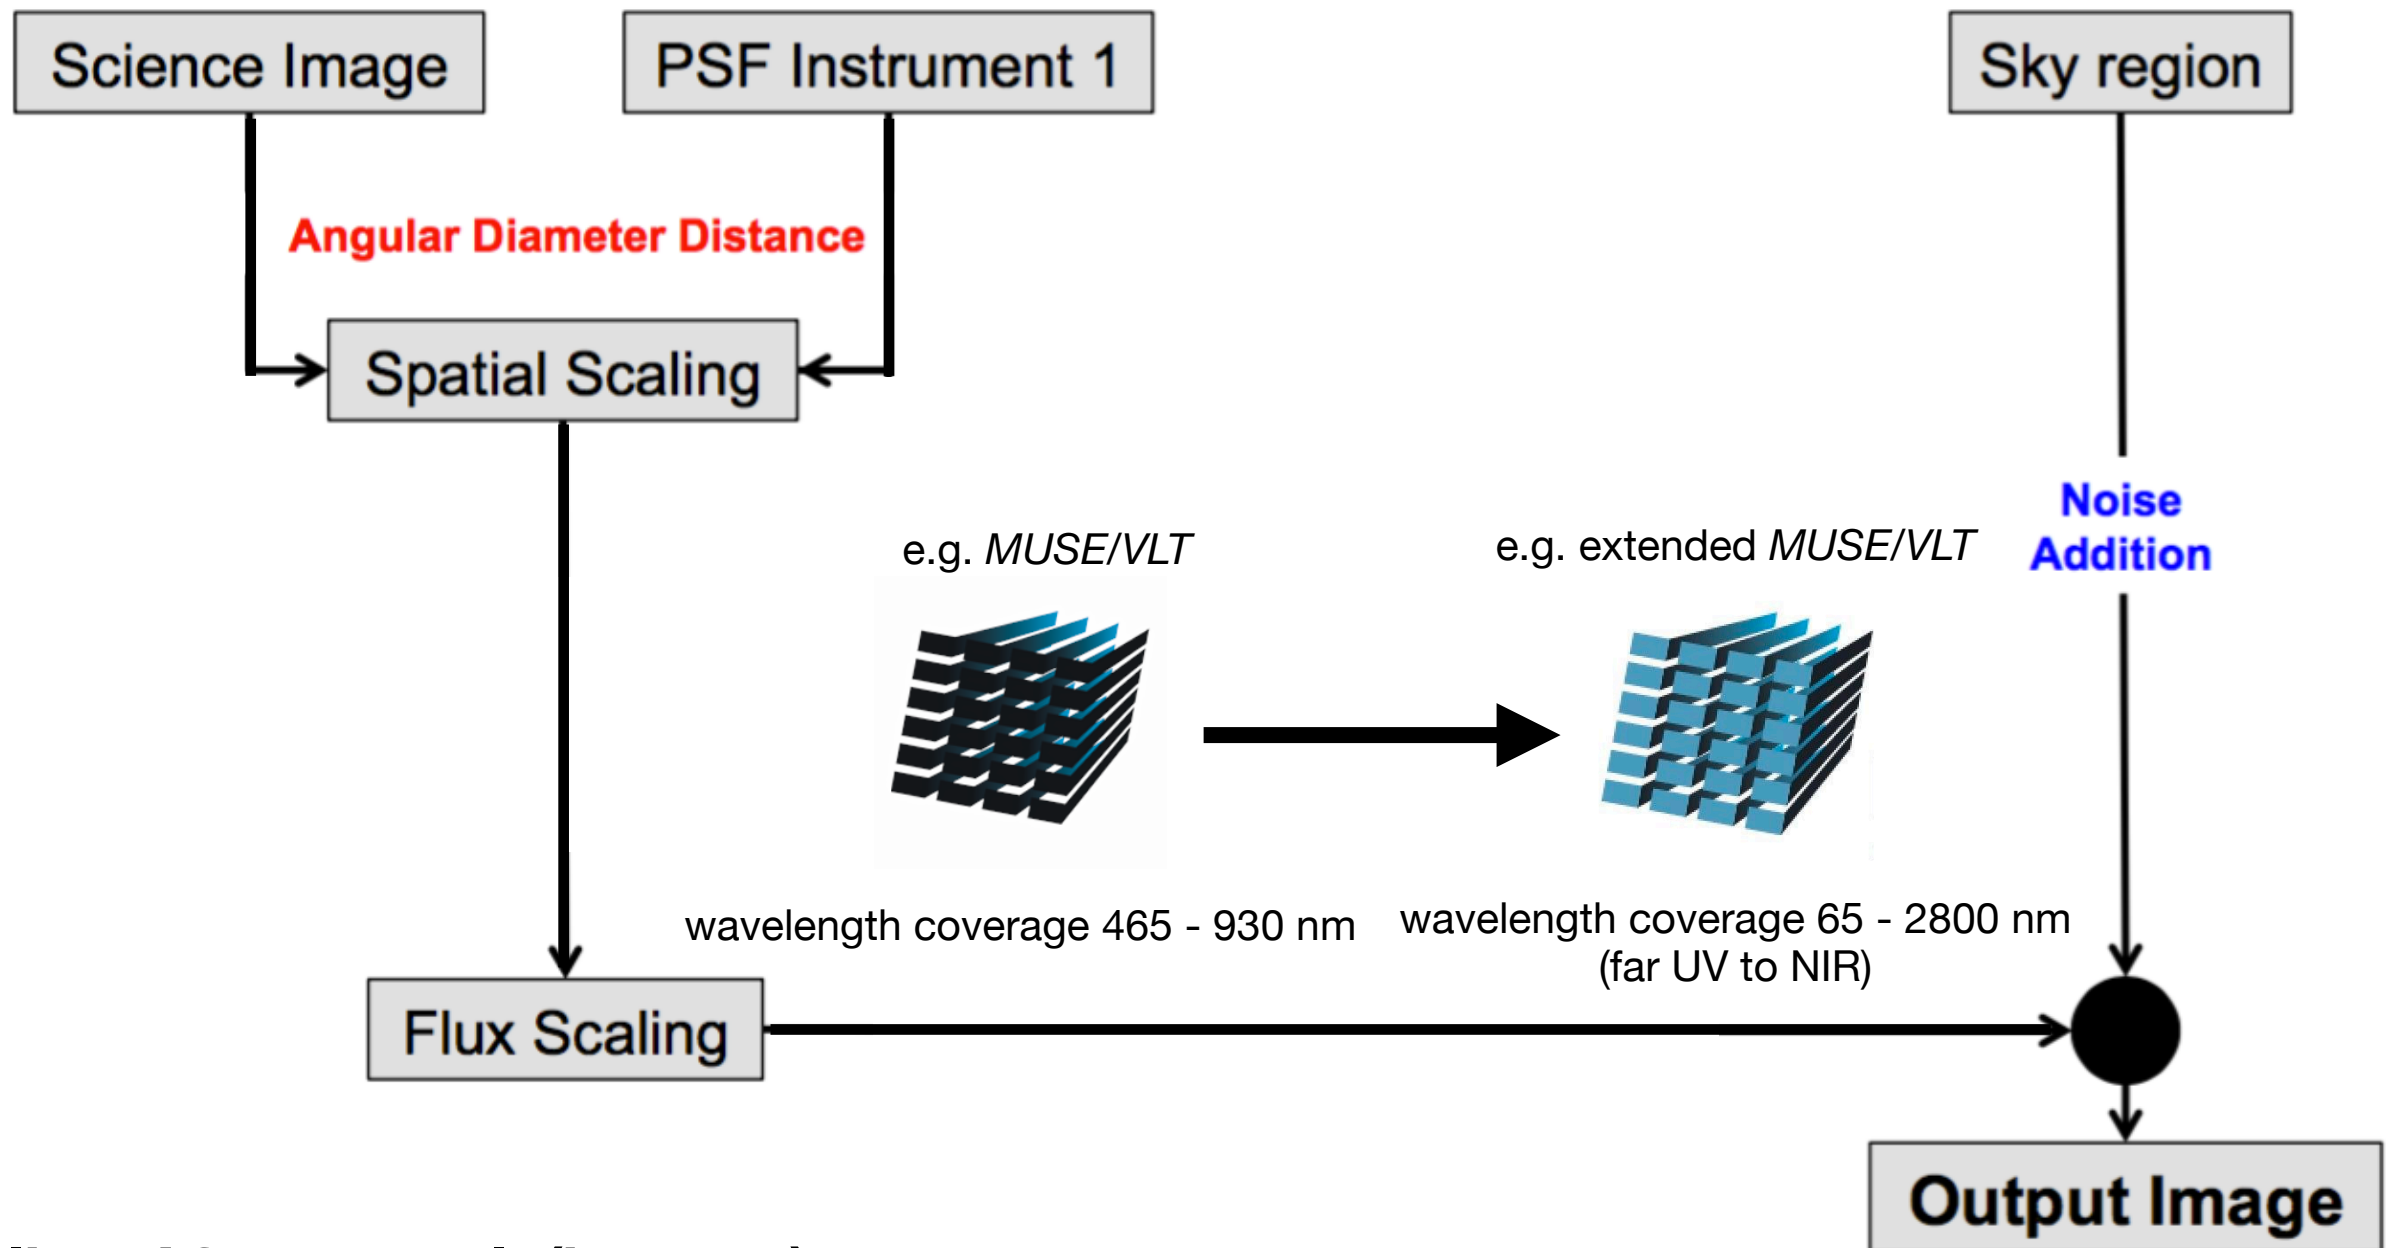

for the importance of SN host morphology in correctly interpreting SN observations see e.g. Lyman et al., 2017; Hill et al. 2018

# Artificial redshifting IFS data

This is the scheme that describes the test that we are performing. I.e. we assume that we can observe a local source at higher redshift using the same instrument.

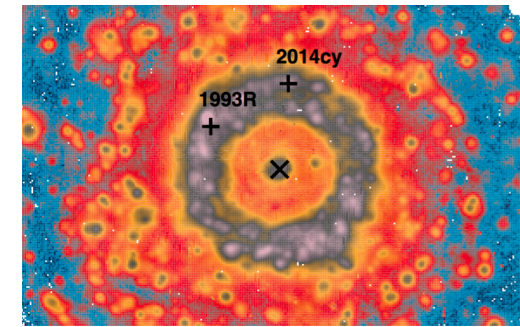

© Paulino-Afonso et al. (in prep.)

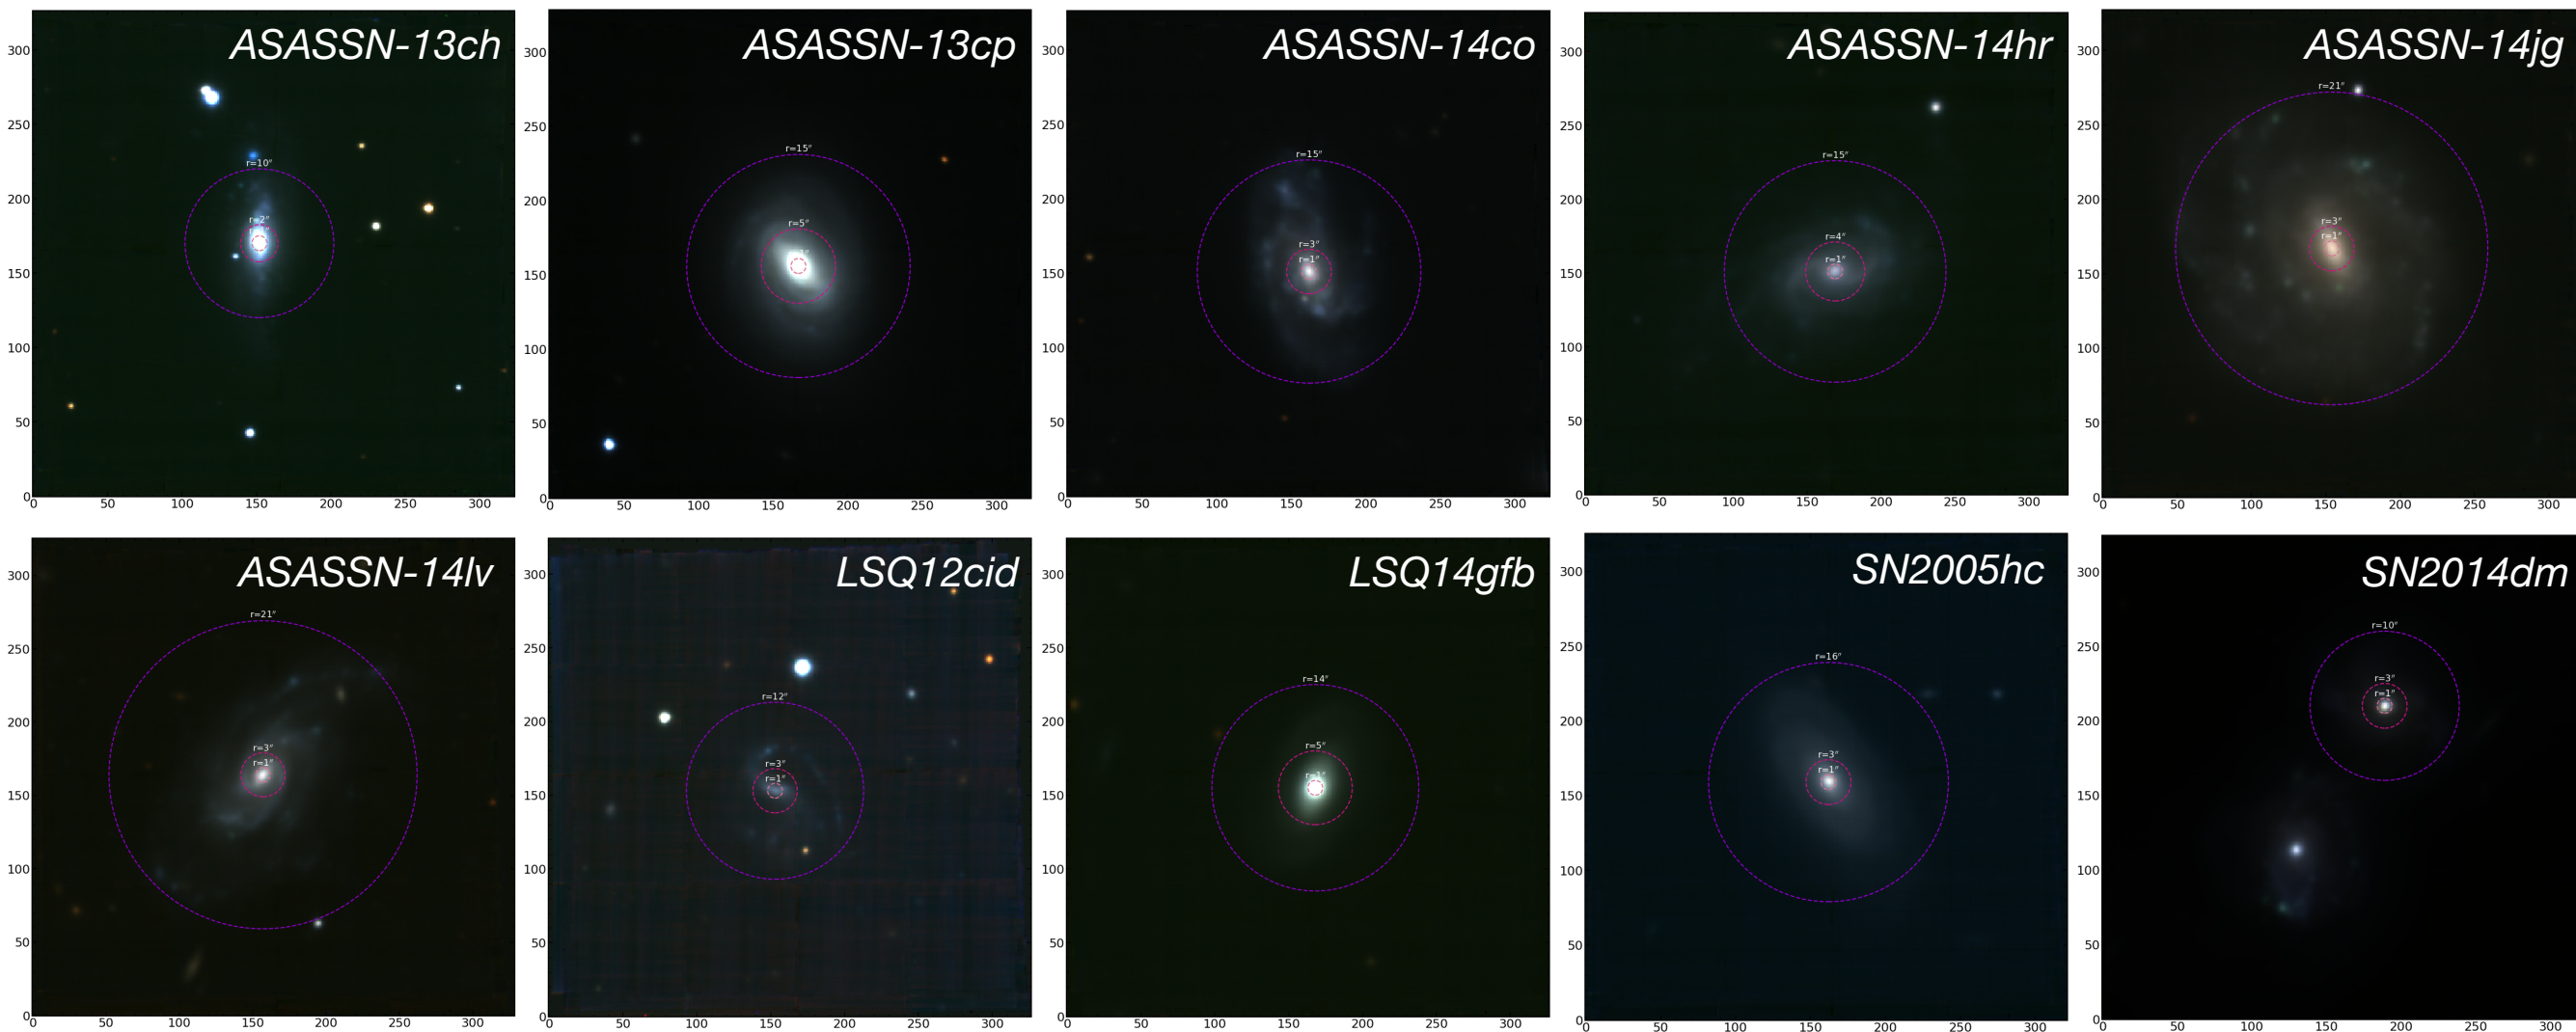

# Data sample

started with a non-representative test sample of the All-weather MUse Supernova Integral field Nearby Galaxies (AMUSING) survey (PIs: J. Anderson & L. Galbany)

Now we are extending the sample to include the ~600 hosts!

RGB images made from the MUSE data cube

see <https://amusing-muse.github.io/>

see also eg. Galbany et al., MNRAS, 2016, 455, 4087-4099 (arXiv: 1511.01495)

# Research approach

## 1) Object selection

segmentation map

object extraction

Collapsed MUSE data cubes.  $S/N > 5$ .

select pixels belonging to object for artificial redshifting

**SExtractor-like (Bertin & Arnouts, 1996)**

# Research approach

2) *Fitting stellar populations to individual spaxels to generate a wavelength extended data cube*

© Starlight, Cid Fernandes et al. (2005)

# Research approach

## 3) Applying dimming to each cube for each cosmic time slice

the flux in each pixel of the galaxy will diminish by a  $(1+z)^3$  factor due to cosmological surface brightness dimming.

# Research approach

## 4) Rescaling the galaxy to match the spatial resolution at each cosmic slice

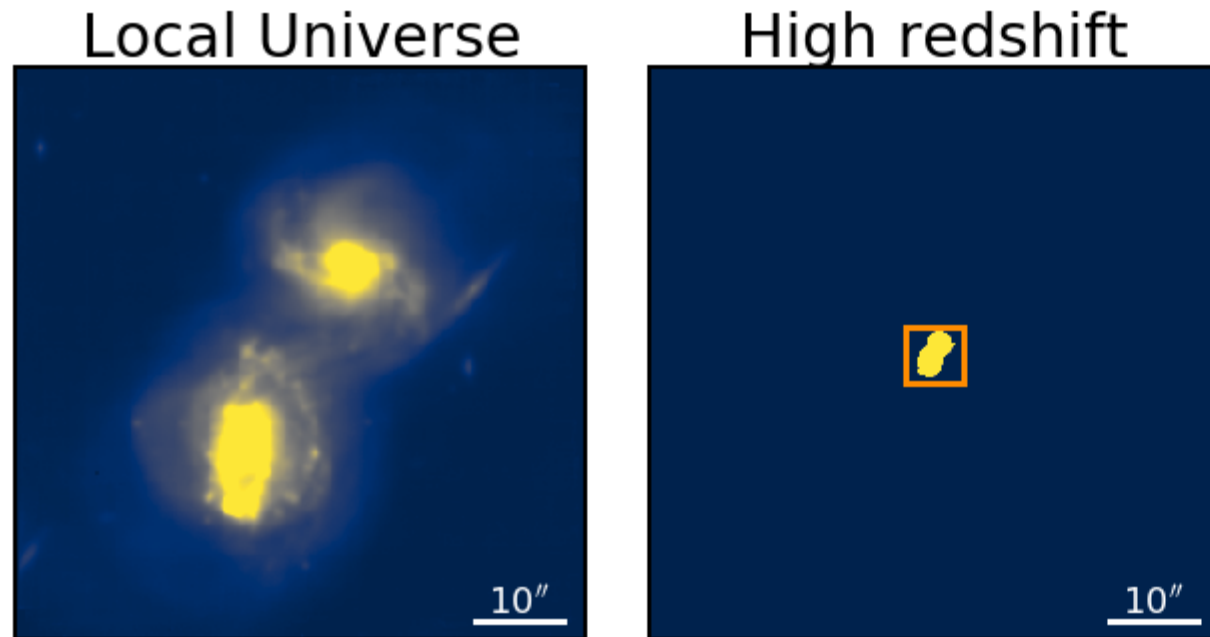

the galaxy being more distant will occupy a smaller angular section of the sky, which translates into a smaller number of pixels (as the pixel-scale is constant)

# Research approach

## Summary

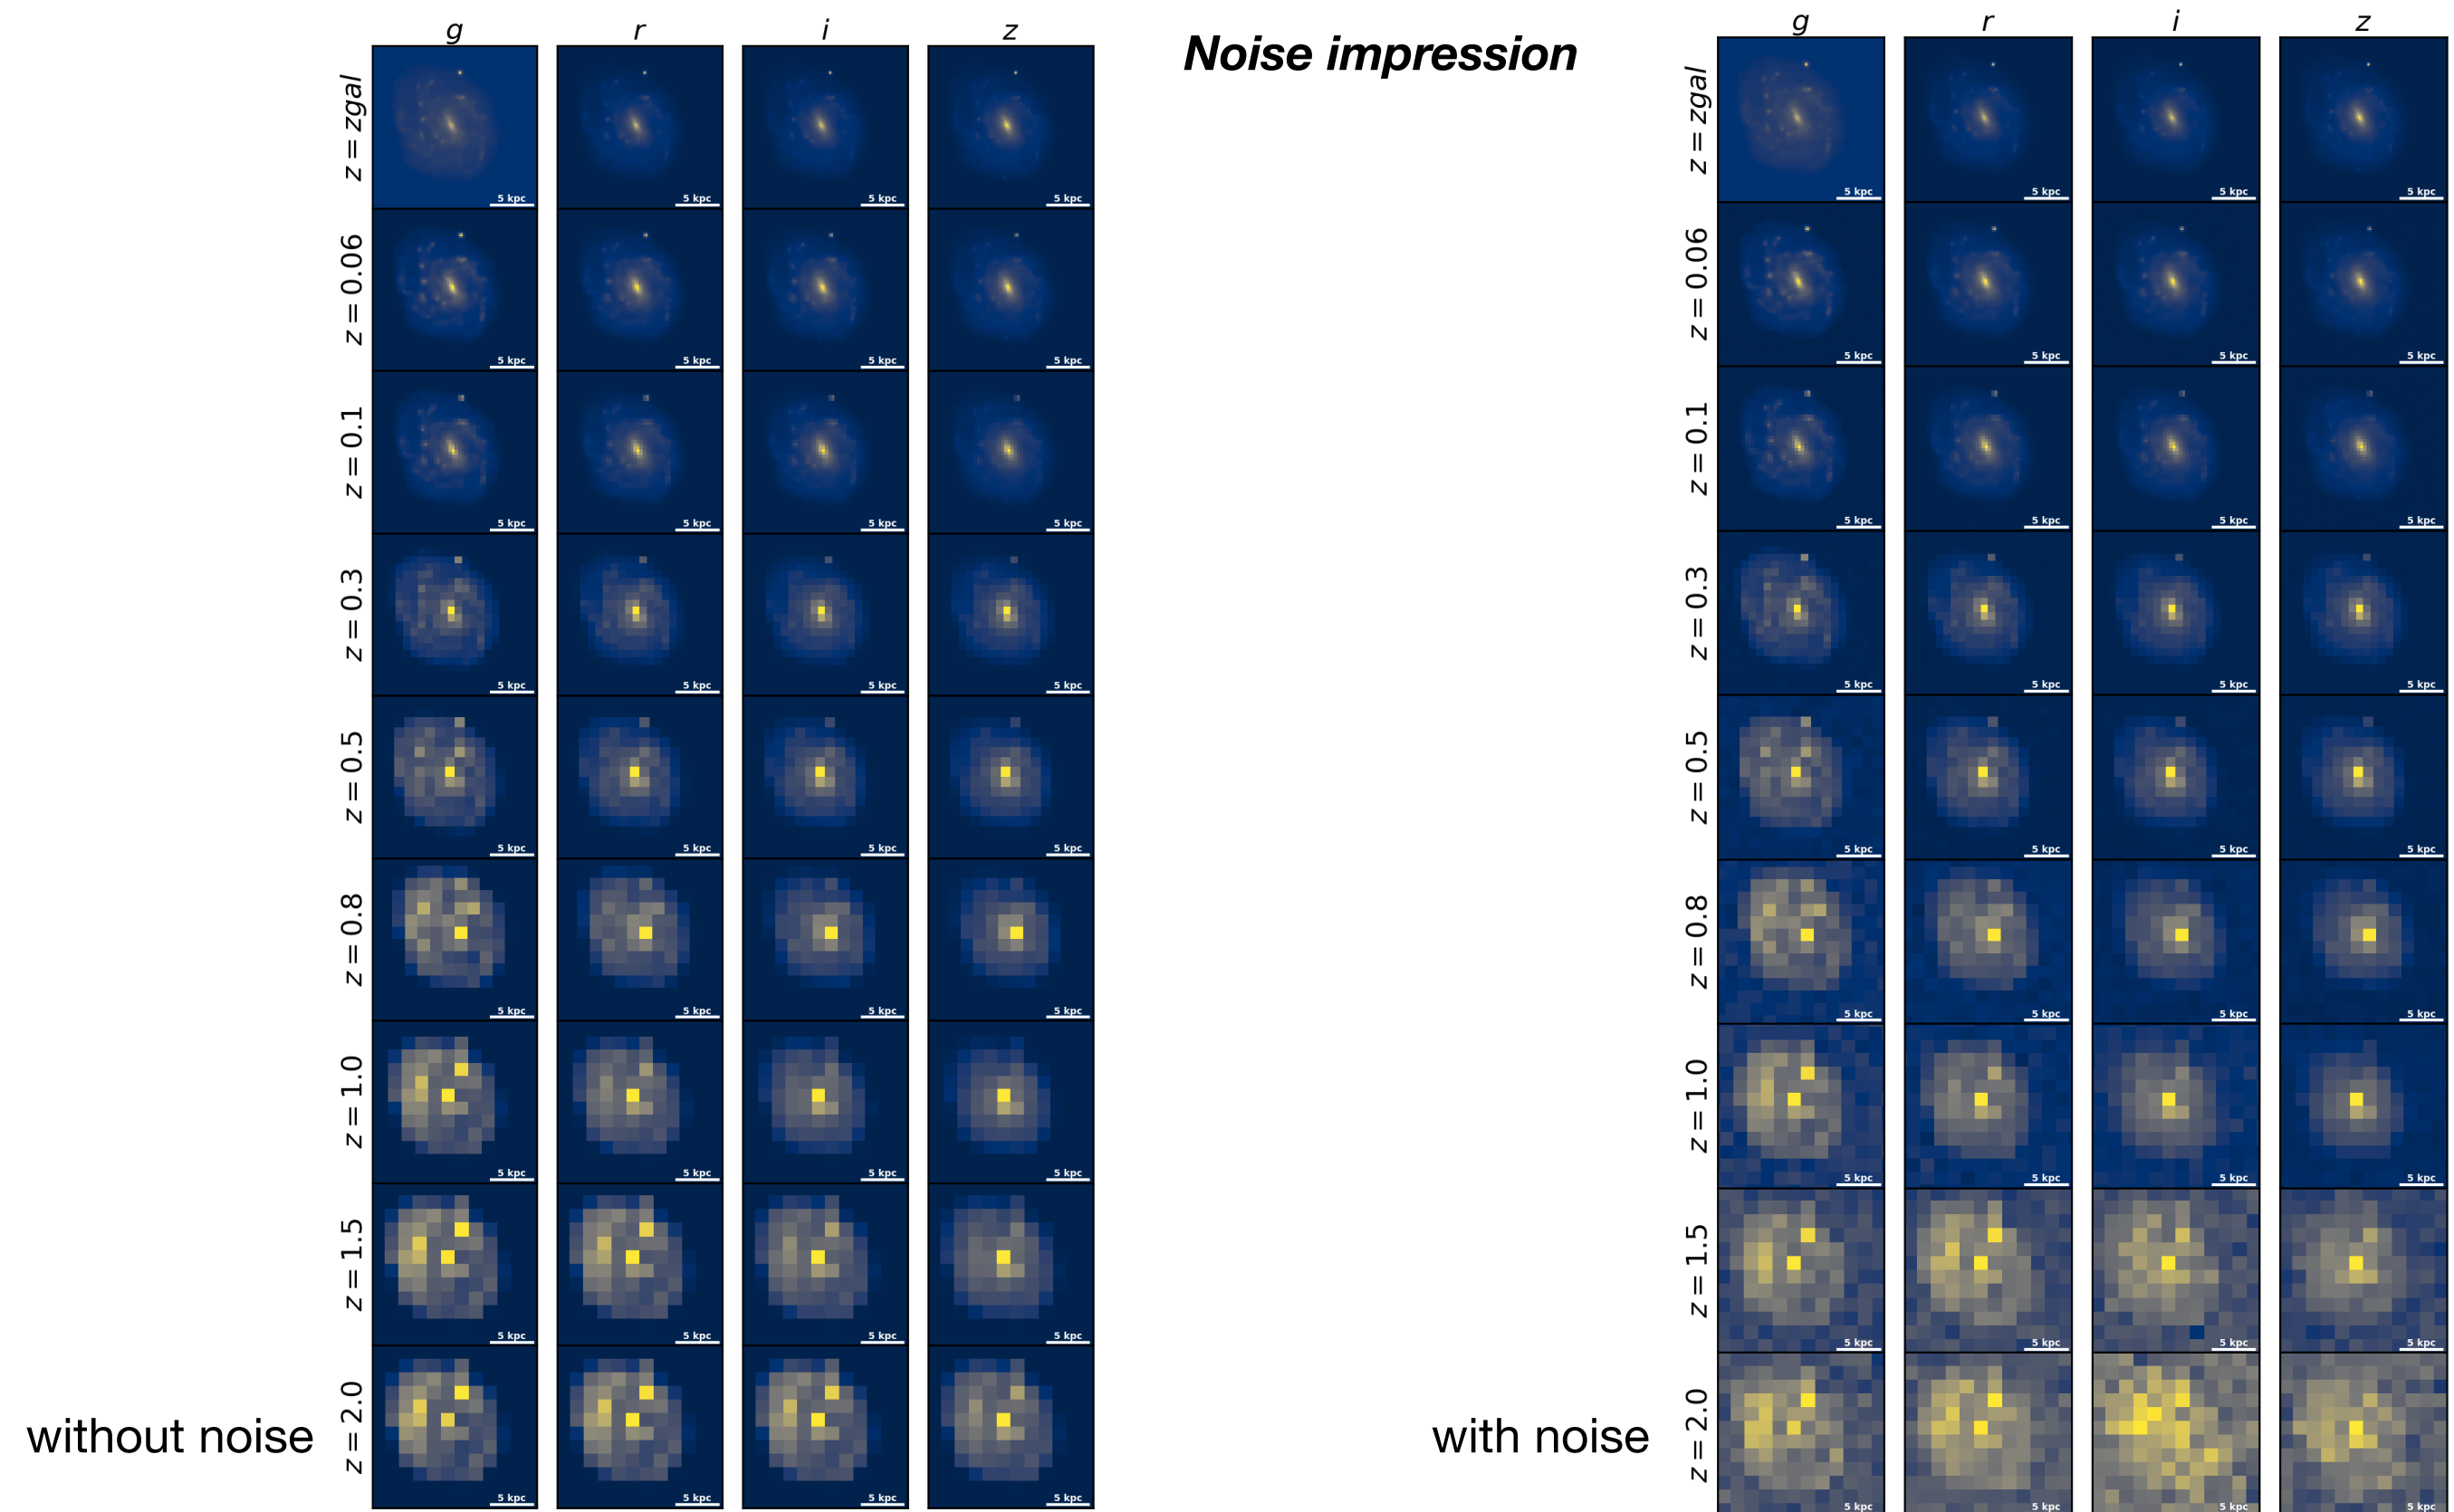

dimming tries to kill everything,  
but scaling brings part back

# Research approach

## Noise impression

---

- In the era of precision cosmology, it is necessary to have a good control of the systematics.
- This work in progress is crucial to understand biases and systematics that one may have when comparing low- and high-redshift results both on local or global properties.
- Stellar masses are robustly estimated up to  $z \sim 1$  using griz magnitudes. However, if one wants to go towards higher redshift, redder bands are needed (the  $D_n4000\text{\AA}$  break should be well constrained).
- Feedback is more than welcome since we aim to develop a publicly available tool for the community to tackle different science cases.
